

# Aerolatte

## Basic frothing instructions:

- 1) Fill one third of a tall mug with milk and heat to 60°C. For milkshakes, ensure the milk is fridge cold.
- 2) Insert aerolatte's whisk into the milk close to the mug's base.
- 3) Switch on for 15-20 seconds moving the whisk slowly around the outside of the mug. As the milk begins to thicken, raise the aerolatte so that it is always just under the top of the froth. Dip it down again every now and again just to be sure that all the milk is getting frothed.
- 4) Remember to switch off the aerolatte before removing it from the milk.

## How to clean the aerolatte milk frother:

Clean the aerolatte frother before first use. Operating the frother in hot soapy water and then rinsing it will thoroughly clean the stainless steel whisk and shaft. Switch on for a few seconds to dry. Do not try and pull the rod from the handle as it is firmly attached to the motor. Wipe the handle occasionally with a damp cloth, but do not immerse the handle in water or put the unit in the dishwasher.
